Investment appraisal

3.7 Analysing the strategic position of a business

3.7.8 Analysing strategic options: investment appraisal

A revision lesson. Pupils run a car dealership in firms of four and revise investment appraisal on their own deals. Seat each firm together. Each firm answers the topic tasks together.

What pupils do

Every pupil buys and sells cars. In Firm decisions, each role has its own job.

CEO

Staff · Sabotage from Round 2

Finance

Capital & Loans · Investments

Sales & Marketing

Marketing

Operations

Seasonal stock

Topic tasks

Each firm gets its own figures. The method is the same. Your Live screen shows each task and every firm's answer.

1 Average profit

Round 1

New charging points.

Average profit each year?

Cost to set up	**£30,000**
Returns over its life	**£66,000**
It lasts	**4 years**

ANSWER

£9,000

(£66,000 − £30,000) ÷ 4 = £9,000

Why: Average yearly profit is total profit shared over the years.

2 Limits of payback

Round 1

You choose between two projects by payback.

Which two are limits of payback?

- **A** It ignores returns after payback
- **B** It is hard to work out
- **C** It ignores the time value of money
- **D** It favours slow projects
- **E** It ignores the project's cost

ANSWER

✓ It ignores returns after payback
✓ It ignores the time value of money

Why: Payback stops at the payback point and treats a pound later as a pound now.

3 Rank by payback

Round 2

Three projects with even yearly returns.

Order by payback, fastest first?

- **A** Cost £60,000, £20,000 a year
- **B** Cost £30,000, £12,000 a year
- **C** Cost £40,000, £10,000 a year

ANSWER

1. **Cost £30,000, £12,000 a year**
2. **Cost £60,000, £20,000 a year**
3. **Cost £40,000, £10,000 a year**

Why: Payback: 2.5, 3 and 4 years.

Topic tasks

4 Payback in months

Round 2

A new valeting bay.

Payback period, in months?

Cost to set up	**£17,100**
Returns, each year	**£8,290**
Running costs, each year	**£1,450**

ANSWER

30 months

£8,290 − £1,450 = £6,840;
£17,100 ÷ £6,840 × 12 = 30

Why: It has paid for itself after 30 months.

5 Ramp or bay

Round 3

Ramp: payback 2 years, ARR 10%. Bay: payback 4 years, ARR 18%. Demand is stable; cash is fine.

Which project should you choose, and why?

A The ramp

B The bay

ANSWER

✔ **The bay**

Why: With little risk and cash to spare, the higher return wins.

6 Quicker payback

Round 3

Which pays back first?

Payback of the quicker option, in months?

Option A: cost	**£17,700**
Option A: returns a year	**£7,080**
Option B: cost	**£38,880**
Option B: returns a year	**£12,960**

ANSWER

£30

A 30 months; B 36 months; quicker 30

Why: The shorter payback gets the money back sooner.

Final questions

Each pupil answers 6 final questions on investment appraisal. They come from these 11 questions.

Then each pupil writes one short answer: “Evaluate the limits of using ARR to decide.”

1 An inspection line costs £300,000 and should make £45,000 average annual profit. On original cost, what is its accounting rate of return?
✔ **15%**

2 A £180,000 paint booth returns £60,000, £75,000 and £90,000 over three years. Ignoring timing within years, what is its payback period?
✔ **2.5 years**

3 A project requires £120,000 now and has discounted future cash inflows of £138,500. What is its net present value?
✔ **£18,500**

4 A project costs £200,000 and its discounted future cash inflows total £224,000. What is NPV?
✔ **£24,000**

5 A system costs £250,000 and is expected to earn average annual profit of £30,000. What is ARR using original cost?
✔ **12%**

6 An energy-saving project costs £180,000. Discounted savings are £205,000, but a downside scenario reduces those savings by 15%. What is NPV in the downside scenario?
✔ **−£5,750**

7 A £90,000 paint booth brings in £30,000 in year 1, then £40,000 a year. What is its payback period?
✔ **2.5 years**

8 A dealer spends £60,000 on a new workshop ramp, which brings a net cash inflow of £24,000 a year. What is the payback period?
✔ **2.5 years**

9 Two projects cost the same. Project A pays back in 2 years and project B in 4 years. Why might a cautious dealer prefer A?
✔ **It gets its money back sooner, so there is less risk**

10 A dealer invests £80,000 in a valeting centre. Over 5 years the total profit, after taking off the £80,000 cost, is £40,000. What is the ARR?

Final questions

11 Project X has an ARR of 14% and project Y an ARR of 9%. The dealer borrows at 11% a year. On ARR alone, what follows?

✔ **Only project X earns more than the cost of borrowing**
