OCR GCSE (9-1) in Business (J204)

Break-even

5. Finance
5.4 Break-even

A revision lesson. Pupils run a car dealership in firms of four and revise break-even on their own deals. Seat each firm together. Each firm answers the topic tasks together.

What pupils do

Every pupil buys and sells cars. In Firm decisions, each role has its own job.

CEO

Staff · Sabotage from Round 2

Finance

Capital & Loans · Investments

Sales & Marketing

Marketing

Operations

Seasonal stock

Topic tasks

Each firm gets its own figures. The method is the same. Your Live screen shows each task and every firm's answer.

1 Cars to break even

Round 1

They take up to 8 cars.

Cars to break even?

Livery and set-up, one-off	**£8,750**
Customer pays per car	**£9,750**
You pay per car	**£8,000**

ANSWER

£5

£9,750 − £8,000 = £1,750;
£8,750 ÷ £1,750 = 5

Why: Each car adds £1,750, so 5 cars pay the set-up.

2 Lower break-even

Round 1

You want to lower your break-even point.

Which two changes would lower it?

- **A** Pay more for each car
- **B** Sell more cars
- **C** Pay higher rent
- **D** Raise the selling price
- **E** Cut the fixed costs

ANSWER

✓ Raise the selling price
✓ Cut the fixed costs

Why: More added per car or lower fixed costs; selling more does not move it.

3 Rank by break-even

Round 2

Three deals: fixed costs, and what each car adds (price minus cost).

Order by break-even, fewest cars first?

- **A** £4,000 fixed, £500 a car
- **B** £9,000 fixed, £1,500 a car
- **C** £6,000 fixed, £1,500 a car

ANSWER

1. £6,000 fixed, £1,500 a car
2. £9,000 fixed, £1,500 a car
3. £4,000 fixed, £500 a car

Why: Fixed costs ÷ what each car adds: 4, 6 and 8 cars.

Topic tasks

4 Profit on the deal

Round 2

A deal with a set-up cost.

Profit on the deal?

Livery and set-up, one-off	**£7,000**
Customer pays per car	**£10,750**
You pay per car	**£9,000**
They order	**9 cars**

ANSWER

£8,750

9 × (£10,750 − £9,000) − £7,000 = £8,750

Why: The first cars pay the set-up; the rest is profit: £8,750.

5 Less risky deal

Round 3

Both deals are for 10 cars. The taxi deal breaks even at 4 cars, the hire deal at 8.

Which deal is less risky, and why?

A The taxi deal

B The hire deal

ANSWER

✔ The taxi deal

Why: The taxi deal's margin of safety is 6 cars; the hire deal's only 2.

6 New break-even

Round 3

They want £400 off a car.

New break-even in cars? Round up.

Livery and set-up, one-off	**£5,500**
Customer pays per car	**£19,250**
You pay per car	**£17,000**
Price cut per car	**£400**

ANSWER

£3

£18,850 − £17,000 = £1,850; £5,500 ÷ £1,850 → 3

Why: Less added per car (price minus cost) means more cars to break even.

Final questions

Each pupil answers 6 final questions on break-even. They come from these 8 questions.

Then each pupil writes one short answer: “Explain how a higher price changes break-even.”

1 At the break-even level of output, what is true for a dealership?
✔ **Total revenue equals total costs**

2 A dealer’s break-even output is 20 cars a month. In May it sells 24 cars. What does this mean?
✔ **It makes a profit in May**

3 A dealer’s showroom rent rises. Nothing else changes. What happens to its break-even output?
✔ **It rises**

4 A valeting firm raises its price per valet. Nothing else changes. What happens to its break-even output?
✔ **It falls**

5 On a break-even chart, where is the break-even point?
✔ **Where the total revenue line crosses the total costs line**

6 A dealer’s break-even output is 15 cars a month. In March it sells 11 cars. Which statement is correct?
✔ **It makes a loss in March**

7 A cheaper parts supplier cuts the variable cost of each service. Nothing else changes. What happens to break-even output?
✔ **It falls**

8 Why does a new dealer work out its break-even output before opening?
✔ **To know how many cars it must sell to avoid a loss**
