Pricing

Management of marketing
Price: pricing strategies

A revision lesson. Pupils run a car dealership in firms of four and revise pricing on their own deals. Seat each firm together. Each firm answers the topic tasks together.

The lesson

What pupils do

Every pupil buys and sells cars. In Firm decisions, each role has its own job.

CEO

Staff · Sabotage from Round 2

Finance

Capital & Loans · Investments

Sales & Marketing

Marketing

Operations

Seasonal stock

Topic tasks

Each firm gets its own figures. The method is the same. Your Live screen shows each task and every firm's answer.

1 Mark-up to margin

Round 1

Mark-up or margin?

Margin, as % of the price? Nearest whole %.

Full cost per car	**£10,000**
Your mark-up	**25%**

ANSWER

20%

£2,500 ÷ £12,500 = 20.0%

Why: The same profit is a bigger share of the cost than of the price.

2 Inelastic demand

Round 1

Demand for your cars is price inelastic.

Which two are most likely?

A A price cut raises revenue
B Sales fall by a smaller %
C Sales fall by a bigger %
D A price rise raises revenue
E Revenue does not change

ANSWER

✓ Sales fall by a smaller %
✓ A price rise raises revenue

Why: Inelastic: sales change by less than the price, so a rise raises revenue.

3 Rank by elasticity

Round 2

Three price rises and what happened to sales.

Order by elasticity, most elastic first?

A Price up 20%, sales down 20%
B Price up 5%, sales down 10%
C Price up 10%, sales down 5%

ANSWER

1. Price up 5%, sales down 10%
2. Price up 20%, sales down 20%
3. Price up 10%, sales down 5%

Why: PED = % change in sales ÷ % change in price: −2, −1, −0.5.

Topic tasks

4 Price to hit margin

Round 2

Price to hit your target.

Price with the 25% margin?

You pay per car	**£12,260**
Prep per car	**£490**
Target margin on the price	**25%**

ANSWER

£17,000

(£12,260 + £490) ÷ 75% = £17,000

Why: A 25% margin is a 33% mark-up on cost.

5 Cut the price?

Round 3

Price elasticity for your cars is −0.4. Sales are falling.

Should you cut the price, and why?

A Yes, cut the price

B No, keep the price

ANSWER

✓ No, keep the price

Why: At −0.4 a 10% cut adds only 4% sales, so revenue falls.

6 Profit change

Round 3

They buy 30 cars a month.

Change in monthly profit? Minus allowed.

Price per car	**£8,000**
You pay per car	**£6,600**
Price cut	**10%**
Price elasticity of demand	**−2**

ANSWER

−£20,400

36 × £600 − 30 × £1,400 = −£20,400

Why: More cars sold did not make up for the lower price.

Final questions

Each pupil answers 6 final questions on pricing. They come from these 8 questions.

Then each pupil writes one short answer: “Evaluate when a dealer should use price skimming.”

1 A dealer prepares a used car at a total cost of £6,400 and adds a 25% mark-up. What selling price does cost-plus pricing give?
✔ **£8,000**

2 A service costs the workshop £120 in labour and parts and sells for £168. What is the mark-up on cost?
✔ **40%**

3 A car listed at £9,500 is cut by 8% in a January sale. What is the sale price?
✔ **£8,740**

4 A dealer wants a 20% profit margin on the selling price of a car that cost £7,200. What price must it charge?
✔ **£9,000**

5 A new online car-buying service launches with prices well below established dealers to win customers quickly. Which pricing method is this?
✔ **Penetration pricing**

6 A dealer sets its servicing prices in line with the three other garages in town. Which pricing method is this?
✔ **Competitive pricing**

7 A workshop prices every repair at cost plus 30%. Rivals charge far less for simple jobs and it loses that work. What is the main weakness of its method?
✔ **It ignores customers and rivals**

8 After a year of penetration pricing a new dealer group has a large customer base. What is the usual next step?
✔ **Raise prices gradually towards rivals’ levels**
