TEACHER GUIDE DRAFT

Leaving Certificate Business (current syllabus)

Break-even analysis

Unit 5: Business in action

Break-even analysis (an exam item; not named in the syllabus text)

A revision lesson. Pupils run a car dealership in firms of four and revise break-even analysis on their own deals. Seat each firm together. Each firm answers the topic tasks together.

The lesson

What pupils do

Every pupil buys and sells cars. In Firm decisions, each role has its own job.

CEO

Staff · Sabotage from Round 2

Finance

Capital & Loans · Investments

Sales & Marketing

Marketing

Operations

Seasonal stock

Topic tasks

Each firm gets its own figures. The method is the same.

1 Cars to break even

Round 1

They take up to 5 cars.

Cars to break even? Round up.

Livery, one-off	**€2,400**
Staff training, one-off	**€2,150**
Customer pays per car	**€18,760**
You pay per car	**€16,800**

ANSWER

€3

(€2,400 + €2,150) ÷ €1,960 = 2.32 → 3 cars

Why: Part of a car does not sell: 3 whole cars cover the costs.

2 Break-even limits

Round 1

You plan a fleet deal with a break-even chart.

Which two are limits of break-even analysis?

A It needs the firm's cash balance

B It assumes every car is sold

C It leaves out the fixed costs

D It assumes one fixed price

E It cannot show the profit

ANSWER

✓ It assumes every car is sold

✓ It assumes one fixed price

Why: It assumes all output sells at one price; it does show fixed costs and profit.

3 Safety margin as %

Round 2

Three orders, each with its break-even point.

Order by margin of safety as a %, lowest first?

A Order 8 cars, break-even 6

B Order 10 cars, break-even 7

C Order 20 cars, break-even 16

ANSWER

1. **Order 20 cars, break-even 16**
2. **Order 8 cars, break-even 6**
3. **Order 10 cars, break-even 7**

Why: (20 − 16) ÷ 20 = 20%, (8 − 6) ÷ 8 = 25%, (10 − 7) ÷ 10 = 30%.

Topic tasks

4 Profit on the deal

Round 2

A deal with a set-up cost.

Profit on the deal?

Livery and set-up, one-off	**€6,550**
Customer pays per car	**€12,475**
You pay per car	**€10,900**
They order	**9 cars**

ANSWER

€7,625

9 × (€12,475 − €10,900) − €6,550 = €7,625

Why: The first cars pay the set-up; the rest is profit: €7,625.

5 Which price to set

Round 3

You expect 7 sales at either price. At €9,500 a car you break even at 6; at €9,000, at 8.

Which price should you set, and why?

A €9,000 a car

B €9,500 a car

ANSWER

✔ **€9,500 a car**

Why: At 7 sales €9,500 clears its break-even of 6; €9,000 falls short of 8.

6 Margin after rise

Round 3

They order 8 cars.

Margin of safety now, in cars? Round break-even up.

Livery and set-up, one-off	**€7,900**
Customer pays per car	**€16,665**
Cost per car before the rise	**€13,150**
Cost rise	**10%**

ANSWER

€4

€13,150 + 10% = €14,465; €7,900 ÷ €2,200 → 4; 8 − 4 = 4

Why: The cost rise ate into the margin of safety: 4 cars left.

Final questions

Each pupil answers 6 final questions. Pick the question topic “Break-even analysis”: the 6 come from these 10 questions.

1 Fixed costs are €24,000 a month. Each car sells for €9,000 and costs €7,000. How many cars to break even?
✔ **12 cars**

2 Contribution per valet is €40 and fixed costs rise from €18,000 to €20,000 a month. What is the new break-even?
✔ **500 valets**

3 What is contribution per unit?
✔ **Selling price minus variable cost per unit**

4 At break-even, what is true?
✔ **Total revenue equals total costs**

5 Price €1,200 per service package, variable cost €700, fixed costs €15,000. What is the break-even in packages?
✔ **30 packages**

6 Break-even is 40 cars and forecast sales are 55 cars. What is the margin of safety?
✔ **15 cars**

7 Variable cost per car rises because of a weaker euro. Nothing else changes. What happens to break-even output?
✔ **It rises**

8 Which cost is fixed for a dealership?
✔ **Showroom rent**

9 Fixed costs €30,000, price €500 and variable cost €300 per job. What is the profit at 200 jobs?
✔ **€10,000**

10 Break-even is 60 cars and each car contributes €1,500. What are the fixed costs?
✔ **€90,000**
