Pearson Edexcel Level 3 Advanced GCE in Business (9BS0)

Stock control

Theme 2: Managing business activities
2.4 Resource management · 2.4.3 Stock control

A revision lesson. Pupils run a car dealership in firms of four and revise stock control on their own deals. Seat each firm together. Each firm answers the topic tasks together.

What pupils do

Every pupil buys and sells cars. In Firm decisions, each role has its own job.

CEO

Staff · Sabotage from Round 2

Finance

Capital & Loans · Investments

Sales & Marketing

Marketing

Operations

Seasonal stock

Topic tasks

Each firm gets its own figures. The method is the same.

1 Stock holding cost

Round 1

Cars wait in your yard.

Cost of holding the cars?

You hold for them	**10 cars**
Holding cost per car a week	**£90**
Weeks you hold them	**6 weeks**

ANSWER

£5,400

10 × £90 × 6 = £5,400

Why: Stock that waits costs £900 every week.

2 Risks of JIT

Round 1

You move to just-in-time stock.

Which two risks rise most?

- **A** More cars go out of date
- **B** Higher storage costs
- **C** A late delivery stops sales
- **D** Fewer bulk-buying discounts
- **E** More cash tied up in stock

ANSWER

✓ A late delivery stops sales
✓ Fewer bulk-buying discounts

Why: JIT frees cash and space, but depends on every delivery and buys in small lots.

3 Rank stock turnover

Round 2

Three dealers: cost of cars sold in a year, and average stock.

Order by stock turnover, fastest first?

- **A** £450,000 sold, £50,000 stock
- **B** £800,000 sold, £200,000 stock
- **C** £600,000 sold, £100,000 stock

ANSWER

1. **£450,000 sold, £50,000 stock**
2. **£600,000 sold, £100,000 stock**
3. **£800,000 sold, £200,000 stock**

Why: Turnover: 9, 6 and 4 times a year. The biggest dealer is the slowest.

Topic tasks

4 Stock turnover

Round 2

One model, one year.

Stock turnover, times a year? Use average stock.

Cost of cars sold in a year	**£167,400**
Stock at start of year	**£15,420**
Stock at end of year	**£21,780**

ANSWER

9 times

(£15,420 + £21,780) ÷ 2 = £18,600; £167,400 ÷ £18,600 = 9

Why: The stock is sold and replaced 9 times a year.

5 Cut or raise buffer

Round 3

Deliveries now come a week late. A lost sale costs £1,500; one more car in stock costs £80 a week.

What should you do with buffer stock, and why?

A Cut it to save cash

B Raise it

ANSWER

✔ **Raise it**

Why: A lost sale costs far more than a week's holding cost, so a bigger buffer pays.

6 Weeks until reorder

Round 3

When do you order next?

Weeks until you reorder?

They buy each week	**4 cars**
Supplier delivers in	**2 weeks**
Buffer, of lead-time sales	**50%**
In stock	**28 cars**

ANSWER

£4

Lead-time sales 8, buffer 4, level 12; (28 − 12) ÷ 4 = 4

Why: A buffer tied to lead time grows when deliveries are slow.

Final questions

Each pupil answers 6 final questions on stock control. They come from these 8 questions.

1 What is the central trade-off when a dealership adopts just-in-time delivery for common parts?
✔ **Lower holding cost, more supply risk**

2 A critical component supplier fails with no warning. Which earlier policy would most likely have reduced impact without necessarily holding maximum stock?
✔ **Tested backup suppliers for critical parts**

3 The cheapest supplier delivers only 72% of orders on time and in full, causing cancellations. What should Operations do?
✔ **Weigh failure cost against price**

4 A workshop uses just-in-time parts supply. Its main supplier shuts for two weeks after a fire. What is the most likely effect?
✔ **No buffer, so jobs stop at once**

5 Your only parts supplier's lead time rises from two days to nine. Apart from ordering earlier, what else must change?
✔ **More stock must be held, tying up cash and space**

6 A workshop holds 360 oil filters and uses 24 a day. How many days of stock does it hold?
✔ **15 days**

7 Average stock is worth £120,000 and holding costs run at 15% of stock value a year. What is the annual holding cost?
✔ **£18,000**

8 A dealer moves to just-in-time parts delivery. Which risk rises?
✔ **A late delivery stops repairs**
