TEACHER GUIDE

WJEC Eduqas GCSE (9-1) in Business (C510QS)

Production and capacity

Business operations
Methods of production

A revision lesson. Pupils run a car dealership in firms of four and revise production and capacity on their own deals. Seat each firm together. Each firm answers the topic tasks together.

What pupils do

Every pupil buys and sells cars. In Firm decisions, each role has its own job.

CEO

Staff · Sabotage from Round 2

Finance

Capital & Loans · Investments

Sales & Marketing

Marketing

Operations

Seasonal stock

Topic tasks

Each firm gets its own figures. The method is the same.

1 Cars per staff

Round 1

The prep workshop.

Cars prepared per member of staff a day?

Cars prepared a week	**60 cars**
Staff	**6 staff**
Days worked a week	**5 days**

ANSWER

£2

60 ÷ 6 = 10 a week; ÷ 5 = 2 cars

Why: Productivity is output for each worker in a set time.

2 Raise output

Round 1

Your prep workshop is slow.

Which two would raise output per worker?

- **A** Buy better equipment
- **B** Raise your prices
- **C** Train staff in faster methods
- **D** Cut the hours staff work
- **E** Hire more staff with the same tools

ANSWER

✓ Buy better equipment
✓ Train staff in faster methods

Why: Productivity is output per worker; more staff raise output, not productivity.

3 Rank productivity

Round 2

Three workshops: cars prepared a week, and the staff who prepare them.

Order by productivity, highest first?

- **A** 24 cars, 4 staff
- **B** 45 cars, 15 staff
- **C** 40 cars, 8 staff

ANSWER

1. 24 cars, 4 staff
2. 40 cars, 8 staff
3. 45 cars, 15 staff

Why: Cars per worker: 6, 5 and 3. The busiest workshop is the least productive.

Topic tasks

4 New productivity

Round 2

More staff, more cars.

New cars prepared per member of staff?

Cars prepared a week	**28 cars**
Staff	**4 staff**
Extra staff	**3 staff**
Extra cars prepared a week	**28 cars**

ANSWER

8 cars

(28 + 28) ÷ (4 + 3) = 8 cars

Why: Productivity rose from 7 to 8 cars per worker.

5 One-off big order

Round 3

Your workshop is fully booked. A one-off big order arrives.

How should you handle it, and why?

A Pay overtime for this order

B Build a new prep bay

ANSWER

✔ Pay overtime for this order

Why: A one-off order does not justify the cost of a new bay.

6 Productivity rise %

Round 3

New tools and training.

Rise in cars per worker, as a %?

Cars a week, before	**16 cars**
Staff, before	**4 staff**
Cars a week, after	**18 cars**
Staff, after	**3 staff**

ANSWER

50%

16 ÷ 4 = 4; 18 ÷ 3 = 6; (6 − 4) ÷ 4 × 100 = 50%

Why: Each worker now prepares 6 cars a week, not 4.

Final questions

Each pupil answers 6 final questions on production and capacity. They come from these 8 questions.

1 Which situation is best suited to job production?
✔ **Restoring one classic car to a customer's wishes**

2 What is a likely advantage of flow production for standardised components?
✔ **High volumes at a low cost per unit**

3 A workshop queues every Saturday but has spare weekday capacity. What should it do before paying for a permanent extra bay?
✔ **First test moving work to weekdays**

4 A viral review causes a sudden rise in service bookings. What is the best short-term response?
✔ **Prioritise bookings and add trained help**

5 A workshop converts one van at a time to each customer's own design. Which production method is this?
✔ **Job production**

6 A parts maker produces thousands of identical brake pads on a continuous line. What is a main advantage of this flow production?
✔ **Low cost per unit from high volume**

7 A body shop paints each car in the exact colour and design the customer asks for. Which method of production is this?
✔ **Job production**

8 A workshop has 4 mechanics. Together they service 96 cars in a week. What is the labour productivity per mechanic?
✔ **24 cars a week**
