COURSE

Pearson BTEC Level 3 National Extended Diploma in Business (601/7160/1)

Break-even

Unit 3: Personal and Business Finance · E2 Break-even analysis

Revision for Unit 3: Personal and Business Finance: each firm works it out on its own deals.

Class **Pearson BTEC Level 3 National in Business** Topic **Break-even**

THE LESSON

Setup	3 min
Round 1	Decisions 3 min · Deals 5 min · Topic tasks 4 min
Firm decisions · Deals · Topic task 1 · Topic task 2	
Round 2	Decisions 3 min · Deals 5 min · Topic tasks 4 min · B2B deal 3 min
Firm decisions · Deals · Topic task 3 · Topic task 4 · B2B deal	
Round 3	Decisions 3 min · Deals 5 min · Topic tasks 4 min · B2B deal 3 min
Firm decisions · Deals · Topic task 5 · Topic task 6 · B2B deal	
Final questions	3 min

Fits a 30-minute lesson setting; longer settings add more deals.

Each step

Firm decisions	Each role makes its decision on its own page.
Deals	Each pupil trades with a classmate in another firm.
Topic task	The firm answers together. Everyone presses Agree.
B2B deal	One firm sells a lot of cars to another firm.
Final questions	Each pupil answers six questions.

Firm decisions

CEO	**Staff**	Hire staff. Each costs a salary and gives one benefit.
	Sabotage FROM ROUND 2	Hit a rival firm's cash, at a cost. A Legal Counsel blocks it.
Sales & Marketing	**Marketing**	Book one advert campaign to lift the next sales.
Finance	**Capital & Loans**	Borrow cash. The firm pays it back with interest.
	Investments FROM ROUND 2	Buy property or funds. The value can rise or fall.
Operations	**Seasonal stock**	Order the season's cars in advance.

B2B deal · Rounds 2 and 3

One firm sells a lot of 3 cars to another firm (4 in Round 3). With an odd number of firms, two firms offer to sell and the lower price wins.

Topic tasks

Each firm gets its own figures. The method is the same for every firm.

Task 1

ROUND 1

They take up to 5 cars.

Cars to break even? Round up.

WORK OUT THE NUMBER · EXAMPLE FIGURES

Livery, one-off	**£2,400**
Staff training, one-off	**£2,150**
Customer pays per car	**£18,760**
You pay per car	**£16,800**

METHOD

Break-even = (both one-off costs) ÷ (customer pays – you pay), rounded up

(£2,400 + £2,150) ÷ £1,960 = 2.32 → 3 cars

Why: Part of a car does not sell: 3 whole cars cover the costs.

Task 2

ROUND 1

You plan a fleet deal with a break-even chart.

Which two are limits of break-even analysis?

PICK TWO

- ✔ **It assumes every car is sold**
- ✔ **It assumes one fixed price**
- ○ It cannot show the profit
- ○ It leaves out the fixed costs
- ○ It needs the firm's cash balance

Why: It assumes all output sells at one price; it does show fixed costs and profit.

Task 3

ROUND 2

Three deals: price per car, cars sold, break-even.

Order by margin of safety in £, lowest first?

PUT THESE IN ORDER, FIRST TO LAST · RIGHT ORDER

1. **£6,000 a car: sell 16, break-even 10**
2. **£10,000 a car: sell 12, break-even 8**
3. **£15,000 a car: sell 9, break-even 6**

Why: 6 × £6,000 = £36,000, 4 × £10,000 = £40,000, 3 × £15,000 = £45,000.

Task 4

ROUND 2

A deal with a set-up cost.

Profit on the deal?

WORK OUT THE NUMBER, THEN PICK IT · EXAMPLE FIGURES

Livery and set-up, one-off	**£6,550**
Customer pays per car	**£12,475**
You pay per car	**£10,900**
They order	**9 cars**

METHOD

Profit = cars ordered × (customer pays − you pay) − set-up

9 × (£12,475 − £10,900) − £6,550 = £7,625

Why: The first cars pay the set-up; the rest is profit: £7,625.

Task 5

ROUND 3

You expect 7 sales at either price. At £9,500 a car you break even at 6; at £9,000, at 8.

Which price should you set, and why?

PICK A OR B AND GIVE A REASON

- ○ £9,000 a car
- ✔ **£9,500 a car**

Why: At 7 sales £9,500 clears its break-even of 6; £9,000 falls short of 8.

Task 6

ROUND 3

They order 8 cars.

Margin of safety now, in cars? Round break-even up.

WORK OUT THE NUMBER · EXAMPLE FIGURES

Livery and set-up, one-off	**£7,900**
Customer pays per car	**£16,665**
Cost per car before the rise	**£13,150**
Cost rise	**10%**

METHOD

Margin of safety = cars ordered − new break-even (cost after the rise)

£13,150 + 10% = £14,465; £7,900 ÷ £2,200 → 4; 8 − 4 = 4

Why: The cost rise ate into the margin of safety: 4 cars left.

Final questions

6
questions for each pupil

112
Level 3 Business questions

8
of them on break-even

The game draws 6 of the 112 Level 3 questions; these 8 are about break-even.

1 A component sells for £48. Variable cost is £30 a unit and fixed costs are £54,000 a month. What is monthly break-even output?
3,000 units.

2 A repair plan costs £36 a month, variable cost £12, fixed costs £72,000. Expected sales are 4,000 plans. What is the margin of safety?
1,000 plans.

3 A vehicle sells for £22,500 and its variable acquisition and preparation cost is £17,100. What is unit contribution before fixed costs?
£5,400.

4 Monthly fixed costs rise from £90,000 to £108,000 while contribution remains £300 per vehicle. By how many vehicles does break-even output increase?
60 vehicles.

5 Contribution is £2,400 a vehicle at today's price; matching a rival cuts it to £1,500. Fixed costs are unchanged. Which effect follows?
Break-even rises: each sale covers less fixed cost.

6 A tyre service charges £120 per job, variable cost is £72 and monthly fixed costs are £38,400. What is break-even output?
800 jobs.

7 A service plan sells for £50 a month, has variable fulfilment cost of £18 and fixed monthly support cost of £96,000. What is break-even membership?
3,000 members.

Final questions

8 Fixed costs are £84,000. Each vehicle sells for £16,000 and has a variable cost of £12,000. What is the break-even output?

21 vehicles.
